

CSS for Paged Media (Pt 5 Refactoring)

Objective: Refactor the CSS code.

Starter files: Use the Canned Fruit site you completed in Part 4.

Introduction

At this point, everything works and you have a great PDF eBook. Unfortunately, the CSS code isn't organized. There are duplicate rules in the screen and print CSS and the print CSS isn't organized or commented.

Part 5a: Ready the HTML

1. Add a new LINK tag in your HTML to link to a new CSS file named: **both.css**
2. Create the *both.css* file in the appropriate folder.

Part 5b: Share Duplicate Rules

1. Scour both the **screen.css** and **print.css** files and locate rules that are duplicated in both. Move those rules to the **both.css** file (delete them from **screen.css** and **print.css**). There may be rules that aren't quite identical but can still be shared because some declarations may not have any affect on the other media.
2. Organize the rules in the **both.css** file with comments and sequence the rules logically.
3. Organize the rules in the **print.css** file with comments and sequence the rules logically.
4. Test your HTML file in the browser and ensure it still works.
5. Use Prince to export another PDF and ensure the generated eBook still renders as expected.
